

# Homework 1 TeX Code

Suneye Holmes, Economics 7103

January 13, 2025

## 1 Introduction

This sample TeX file can show you some tricks used to automatically update figures and tables. This will get you started on the homework assignments if you are new to LaTeX. Of course, Google is the best guide if you want to figure out how to do something.

## 2 Nice math

LaTeX allows you to format math equations easily and to align everything nicely. For example, use the `\begin{align}...\end{align}` environment with `&` for column delimiters and `\\` for row delimiters:

$$\hat{\beta}_{OLS} = \arg \min_{\beta} \sum_i (y_i - x_i \beta)^2 \quad (1)$$

$$= (X'X)^{-1} X'Y \quad (2)$$

## 3 Sample mean table

You can *automatically* reference table and figure numbers using `\label{}` and `\ref{}`. See table 1.

### 3.1 Python version

	Mean (s.d.)
Outcome	206.51 (43.91)
Variable 1	10.27 (3.01)
Variable 2	20.22 (3.80)
Observations	100

Table 1: Sample mean table. Make sure your captions are informative and that tables and figures can be understood out of context.

(1)	
	Mean/Std. Dev.
Variable 1	11.69 (10.36)
Variable 2	20.67 (14.46)
Outcome variable	209.30 (159.52)
Observations	100

Table 2: Summary statistics produced using Stata

### 3.2 Stata version

## 4 Sample kernel density plot

It is nice to center tables and figures. When making figures, try to avoid using red and green colors together for accessibility. See figure 1.

### 4.1 Python version

Figure 1: Sample kernel density plot of the outcome variable.

### 4.2 Stata version

Stata has a nice color scheme you can install that works for black and white printing and is color-blind accessible:

Figure 2: Sample kernel density plot of the outcome variable generated in Stata

## 5 Sample regression output with CIs

You can see that tables can be updated and input into the main .tex file automatically. To do this, you output your table to a separate .tex file and use `\input{tablename.tex}` to reference it. This might seem silly, but when you have to estimate a dozen regressions over again because your advisor wants you to cluster your standard errors, you will save HOURS of formatting problems by automating.

### 5.1 Python version

See table 3:

	Estimates
Variable 1	-3.250000 (-3.89, -2.75)
Variable 2	12.550000 (12.09, 13.01)
Constant	-14.000000 (-21.75, -6.99)
Observations	100

Table 3: Sample regression output table with confidence intervals! Confidence intervals bootstrapped with 1000 replications. One of the most important things to reference in a table caption is what standard errors you used. It can also be useful to reference the estimating equation if that is in text. See equation 2 for the OLS estimator.

## 5.2 Stata version

See table 4.

(1)	
VARIABLES	Ordinary least squares
Variable 1	-3.03** (0.29)
Variable 2	10.88** (0.21)
Constant	19.82** (6.14)
Observations	100
R-squared	0.97

Standard errors in parentheses  
\*\* p<0.01, \* p<0.05

Table 4: Sample regression output table with standard errors bootstrapped with 1000 replications.

## 6 Sample regression visualization with CI error bars

I really like using confidence intervals to express uncertainty about the estimates (see e.g., Ziliak and McCloskey, 2009). As a rule, it is better to display your results as images rather than as tables, though this is not always feasible. See figure 3 for an example of how you could choose to display OLS estimates with confidence intervals.

### 6.1 Python version

### 6.2 Stata version

See figure 4.

## 7 You can also automate your bibliography

You can include a bibtex/natbib bibliography that automatically formats your references, keeps them in order, and makes them into clickable hyperlinks. It's a little complicated to get started with, but this will also save you hours in the long run. Imagining wasting time looking up Chicago, APA, or MLA formatting—this is a waste when you can automate it.

## 8 Papers, slides, and other documents

For research papers, it is probably best to use LaTeX for the reasons described above (especially when producing an empirical paper). For presentations, many people use the Beamer theme of LaTeX. I would recommend trying it out and keeping it for your job-market talk while in grad school, but in the long run I am less convinced it is worth it. MS Powerpoint is much more customizable and is easier to fit tables on. For other documents with less math and few tables/ figures, just use MS Word.

Figure 3: Regression coefficient estimates with 95% confidence intervals bootstrapped using 1,000 replications.
